

Project 1

AI-Assisted MVP: Designing and Building a Useful Application

Project Overview

In this project, you will design, build, and demonstrate a Minimum Viable Product (MVP) of an application that solves a real problem you personally experience, using AI tools to assist you. The focus is not only on the final product, but on how you worked with AI, particularly through prompt engineering and iteration.

Learning Objectives

By completing this project, you will:

- Apply product-thinking principles to a real problem
- Use AI tools as a development and ideation partner
- Understand the strengths and limitations of AI-generated outputs
- Reflect critically on human–AI collaboration

Task Instructions

Problem Identification

Identify a genuine problem you face in daily life (e.g. studying, budgeting, fitness, organisation). Clearly explain:

- What the problem is
- Who the user is (likely yourself)
- Why existing solutions are insufficient
- Define the MVP

Specify a single core feature your app will provide. Document:

- App purpose
- Primary user journey
- What “success” looks like for this MVP
- Build the MVP Using AI

Use AI tools (e.g. ChatGPT, Copilot, no-code platforms) to help you:

- Design the interface or flow
- Generate or assist with code or logic
- Create a usable prototype (web, mobile, or automation)

Prompt Engineering Narrative

Keep a record of:

- Key prompts you used
- How prompts changed over time
- What worked, what failed, and why
- Where you had to intervene or override the AI

Testing and Reflection

Use the app yourself and reflect on:

- Strengths and weaknesses
- Ethical, reliability, or usability concerns
- Improvements for a future version

Deliverables

- Live or recorded demo of the MVP
- Presentation explaining the problem, solution, and build process
- Written or verbal reflection on prompt engineering
